

2019 OUTCOMES

President's thoughts

Dear readers,
2019 has been a challenging and successful year for Carbiolice. Work and projects focused on developing Evanesto for its commercialization while making our innovation known to everyone within the plastic value chain. All teams work has shown great results, and was awarded with the 2019 SME Awards Most innovative European Biotech company, by EuropaBio. This recognition shows how Evanesto and Carbiolice embody concrete solutions to environmental issues such as plastic pollution.

2020 will be an exciting year for Carbiolice, with the commercial launch of Evanesto. We hope to accompany many companies in their project to switch to fully compostable plastic !

Business success

The signing of the Joint development agreement with Novozymes is a significant milestone and will secure the supply of enzymes for Evanesto.

We have also identified key market segments where to position EVANESTO and entered into discussions with several potential future customers. The K Show in Dusseldorf has also opened the door for a lot of exciting projects.

Our new website has been online for three months now. It is more convenient, and lets you know more about our business and our stakes. If you have not visited it yet, come and have a look to know what's new about Carbiolice and Evanesto !

What's trendy in R&D

The R&D team work has shown great results, with huge progress on many aspects of Evanesto's development. Industrial scale-up started earlier this year, in order to prepare for Evanesto's production and commercialization. Results are promising, and the best is yet to come ! Migration tests also showed tremendous outcomes, with the assurance of the non-migration of the enzyme in a multi-layer structure.

Finally, the TUV Austria certification process is now optimized for our future customers to get the OK Home Compost certification more easily, relying on data submitted by Carbiolice, with less tests to run and a shorter process.

500 billion

of plastic cups are thrown away every year in the world. Turning cups into compostable products could be a first step in the objective of reducing our single-use plastics impact on the environment !

Ongoing production

In 2019, one of the major challenges of the production team was to finalize Evanesto's process and prepare for industrial runs.

Our industrial line has been revamped and adapted to start Evanesto scale-up.

This project went well and all these changes enabled the R&D team to implement its trials and tests in time for the scale-up.
